travis

A little further.
A way back.

Offline route memory
powered by on-device Gemma

Andrew Nguyen Sanjay Ganapathy
Shahin Madantschi

THIS MORNING

Three engineers. Still got lost.

We got lost on the way here.

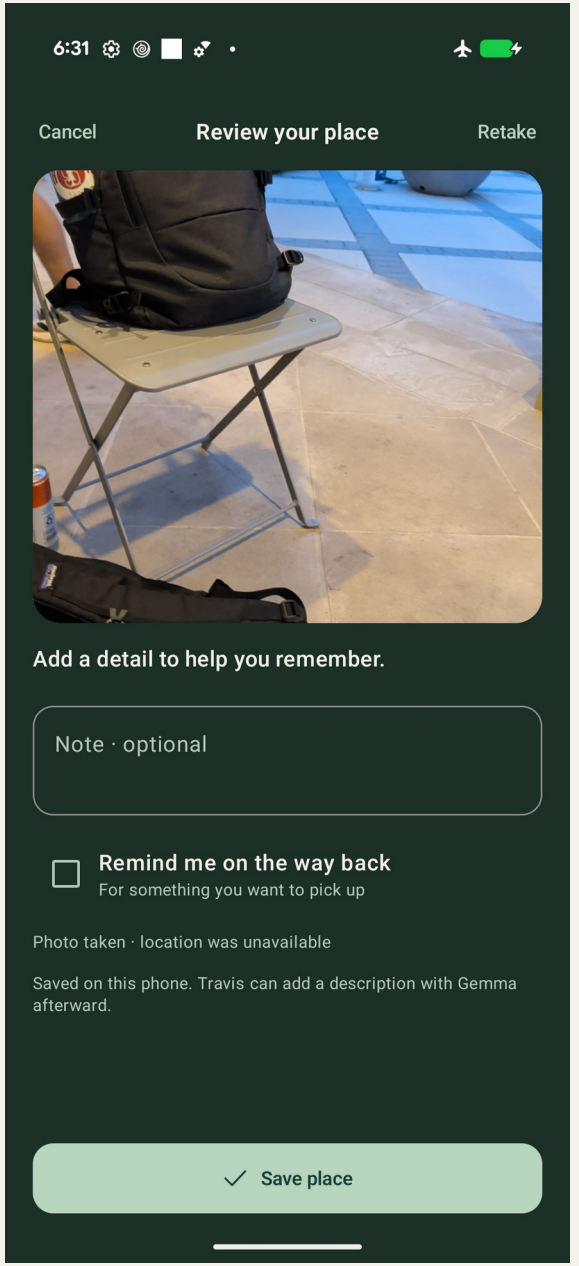

Apparently, this was also user research.

THE QUESTION WE ACTUALLY ASK

“Where did I leave my backpack?”

A saved photo. Your own words.
A place on the walk you recorded.

Photo first. Details after.
Travis can add a visual description.

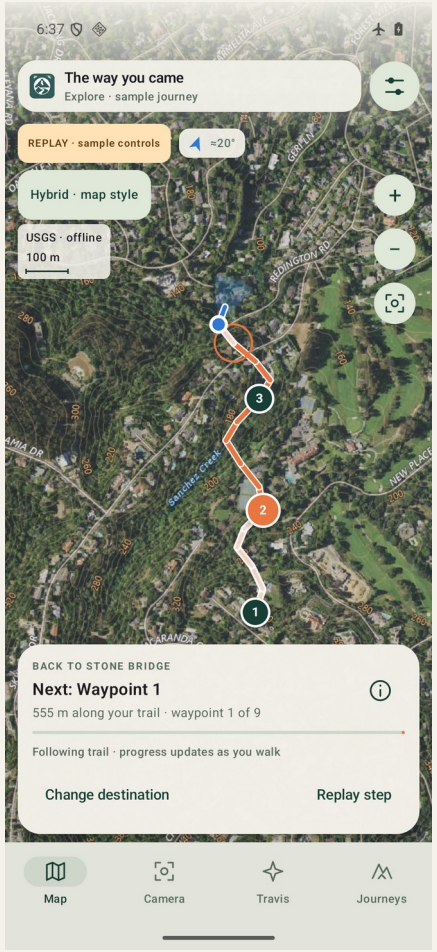

Your walk, with a memory

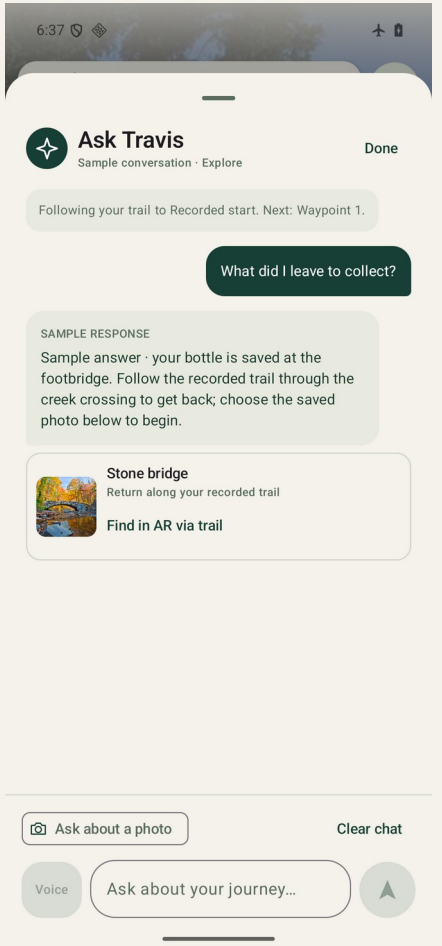

Record the route

GPS keeps the ordered trail.
Prepared maps stay on the phone.

Ask Travis

Use your own words.
Ask a follow-up.
Open the cited original photo.

Current Android UI shown in labelled Explore replay; the live app uses local Gemma.

Back to the gate.
Along your recorded route.

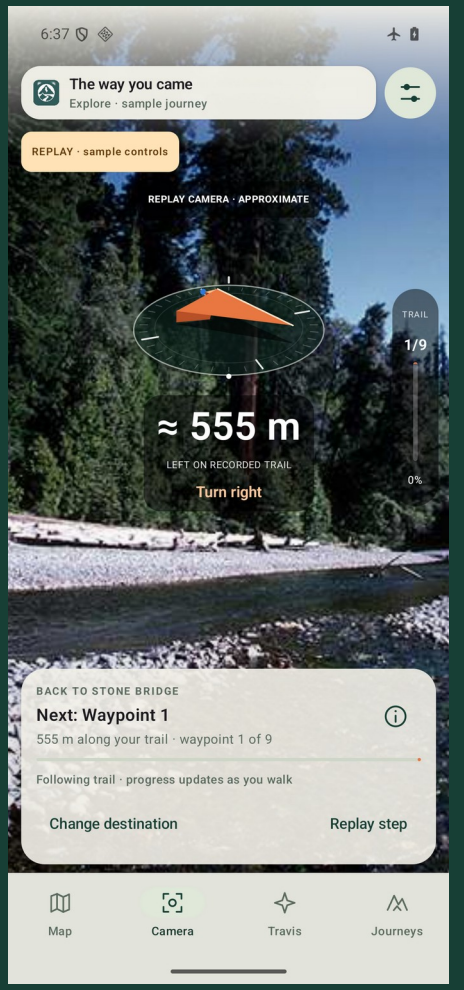

A clear destination

See the place you chose and the original photo.

Progress as you walk

Intermediate points advance along the trail.
You confirm the destination and any pickup.

If GPS is uncertain, the arrow pauses.

Current Android UI / Explore replay. Camera direction is approximate, not world-anchored AR.

Gemma understands the memory

On-device Gemma

Describes a saved photo
Answers about this journey
Compares a view with its landmark

Sensors and route logic

Record GPS independently
Follow the ordered trail
Drive the camera-relative arrow

You confirm recognition, arrival and collection.

The way back comes up everywhere

Hiking

The junction, the campsite, the trailhead.

Cycling

The rest stop and the gear you left there.

Trail running

The landmark between aid stations.

A day outdoors

The jacket at the viewpoint. Yes, again.

WHEN CONDITIONS CHANGE

The outdoors can change the plan

~70

runners and volunteers stranded overnight

Moab 240, October 2026
Flooding cut off the course.
The race required an evacuation.

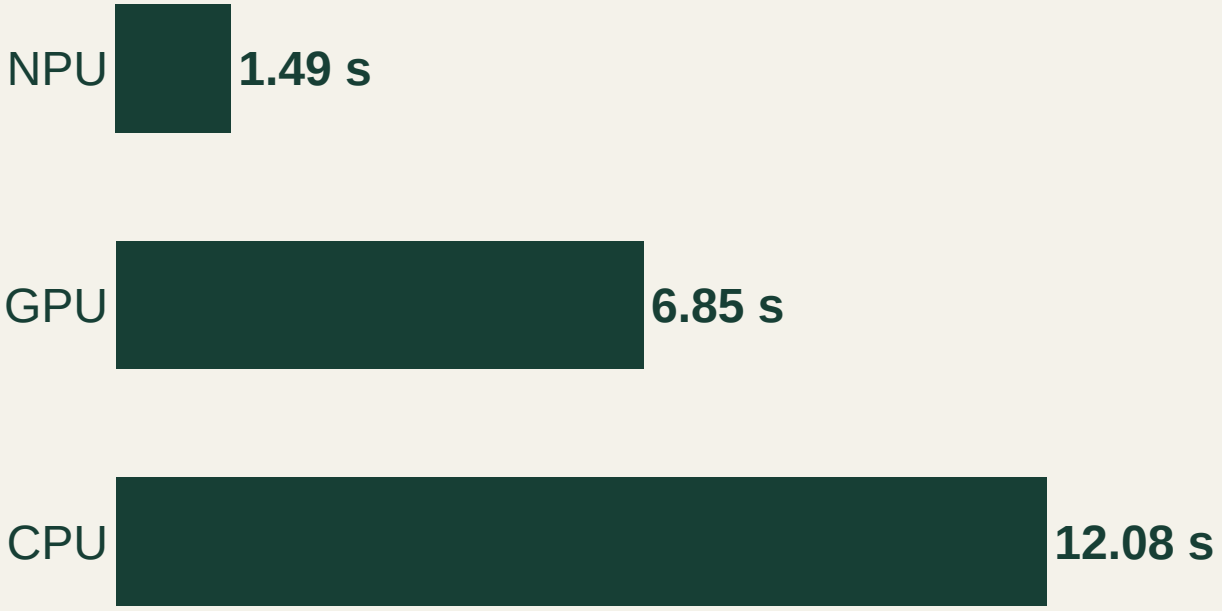

Travis supports route memory.
It cannot judge a flood or replace rescue.

Sources: Destination Trail race organizer; Moab Sun News, October 11, 2026.

Local AI, measured on the Pixel

1.49 s

Gemma cold engine load
on the Tensor G6 NPU

The engine stays loaded
for warm requests.

Small same-phone benchmark. NPU uses the G6 build; CPU/GPU use the generic build. Load time is not answer time.

LIVE DEMO

“Where’s my backpack?”

01

Map

Start a journey.

02

Save

Photo, then note.

03

Ask

Find the saved place.

04

Camera

Recognize the landmark.

05

Retrace

Follow your trail back.

Airplane mode on. Original photos. A real local answer.

travis

A little further.
A way back.

Your trail. Your memories. On your phone.

Andrew Nguyen Sanjay Ganapathy Shahin Madantschi

Cautious photo comparison

Pixel NPU garden test	Strict prompt	Lenient prompt
False matches on different places	0 / 25	9 / 25
True matches found	1 / 3	3 / 3

We preferred fewer false matches, even when the model misses a real match.

28 photo pairs on the Pixel NPU. Small test set; this does not establish field accuracy.

APPENDIX / STATUS

Pixel evidence and field checks

Demonstrated

Local Gemma chat and photo questions
Pixel camera capture and review
Saved routes, places and offline maps
195 unit tests and six emulator checks

Next field checks

Repeat the corrected route with a bend
Check compass alignment while walking
Measure battery cost over a longer trip
Test more phones and environments

No claim of rescue capability, precise visual localization or safe terrain.

APPENDIX / ENGINEERING

The work behind the demo

Tensor NPU integration	A matching Tensor runtime and manifest setup made the G6 model run locally.
Usable model outputs	Schema constraints, allowed IDs and request identity gate the result.
Recorded-route guidance	Local matching follows ordered geometry and pauses uncertain directions.
Independent GPS recording	Model work can fail or cancel without stopping the recorded trail.

APPENDIX / SOURCES

Evidence behind the pitch

183.2 million

Americans participated in outdoor recreation in 2025.
